Lab-Report

Report No:09

Lab Report Name: Implementation of Priority Scheduling Algorithm.

Course code: ICT-3110

Course title: Operating System Lab

Date of Performance: 17-09-2020

Date of Submission:

Submitted by

Name: Tazneen Akter

ID: IT-18056

3rd year 1st semester

Session: 2017-18

Submitted to

Nazrul Islam

Assistant Professor

Dept. of ICT, MBSTU.

Experiment no : 09
Experiment Name : Implementation of Priority Scheduling Algorithm.

Theory :

In priority scheduling algorithm each process has a priority associated with it and as each process hits the queue, it is stored in based on its priority so that process with higher priority are dealt with first. It should be noted that equal priority processes are scheduled in FCFS order.

To prevent high priority processes from running indefinitely the scheduler may decrease the priority of the currently running process at each clock tick (i.e., at each clock interrupt). If this action causes its priority to drop below that of the next highest process, a process switch occurs. Alternatively, each process may be assigned a maximum time quantum that it is allowed to run. When this quantum is used up, the next highest priority process is given a chance to run.

Turnaround Time = Completion Time - Arrival Time

Waiting Time = Turn Around Time - Burst Time

Working Process:

```
#include<stdio.h>

int main()
{
   int bt[20],p[20],wt[20],tat[20],pr[20],i,j,n,total=0,pos,temp,avg_wt,avg_tat;
   printf("Enter Total Number of Process:");
   scanf("%d",&n);

   printf("\nEnter Burst Time and Priority\n");
   for(i=0;i<n;i++)
   {
      printf("\nP[%d]\n",i+1);
      printf("Burst Time:");
      scanf("%d",&bt[i]);
      printf("Priority:");
      scanf("%d",&pr[i]);
      p[i]=i+1;          //contains process number
   }

   //sorting burst time, priority and process number in ascending order using selection
sort
   for(i=0;i<n;i++)
   {
      pos=i;
      for(j=i+1;j<n;j++)
      {
         if(pr[j]<pr[pos])
            pos=j;
      }

      temp=pr[i];
      pr[i]=pr[pos];
      pr[pos]=temp;

      temp=bt[i];
      bt[i]=bt[pos];
      bt[pos]=temp;

      temp=p[i];
      p[i]=p[pos];
      p[pos]=temp;
   }

   wt[0]=0;   //waiting time for first process is zero

   //calculate waiting time
   for(i=1;i<n;i++)
   {
      wt[i]=0;
      for(j=0;j<i;j++)
         wt[i]+=bt[j];
```

```
        total+=wt[i];
    }

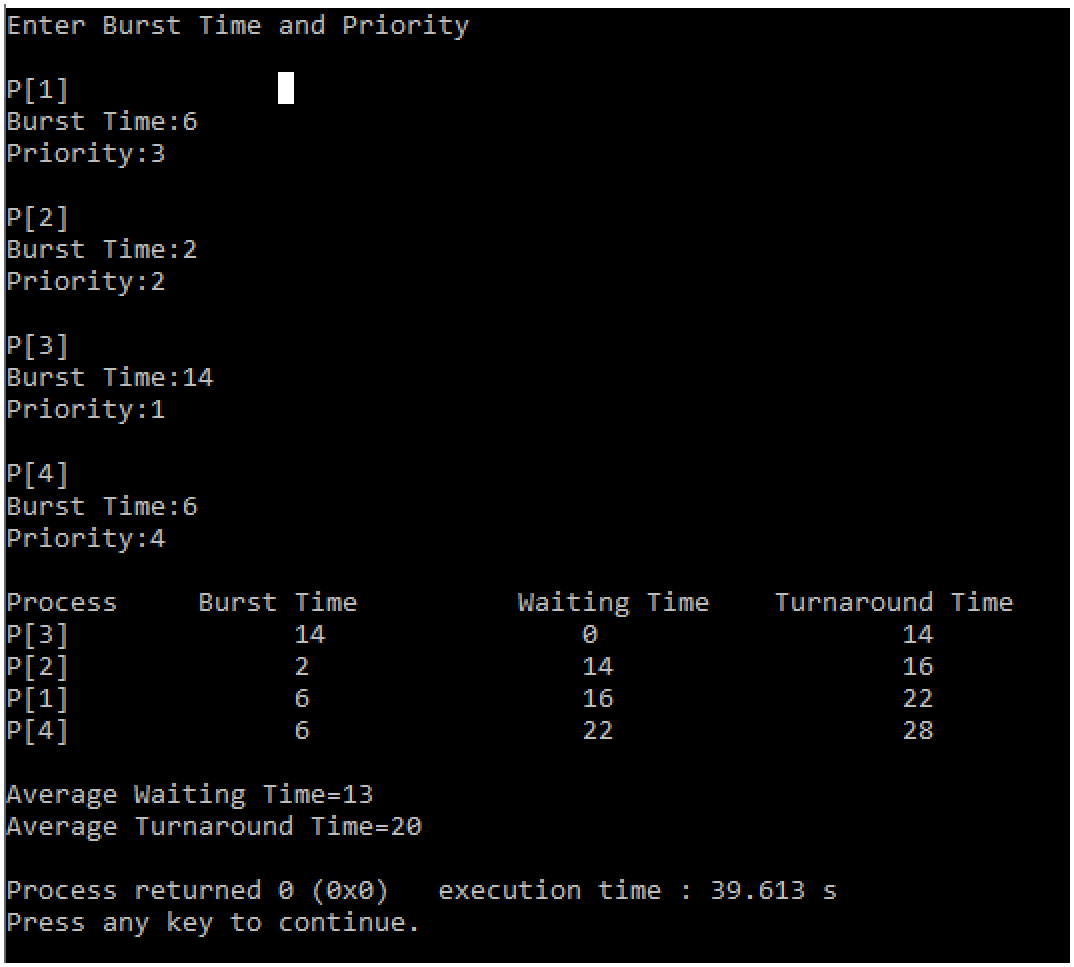
    avg_wt=total/n;      //average waiting time
    total=0;

    printf("\nProcess\t    Burst Time    \tWaiting Time\tTurnaround Time");
    for(i=0;i<n;i++)
    {
        tat[i]=bt[i]+wt[i];     //calculate turnaround time
        total+=tat[i];
        printf("\nP[%d]\t\t  %d\t\t    %d\t\t\t%d",p[i],bt[i],wt[i],tat[i]);
    }

    avg_tat=total/n;     //average turnaround time
    printf("\n\nAverage Waiting Time=%d",avg_wt);
    printf("\nAverage Turnaround Time=%d\n",avg_tat);

            return 0;
}
```

Output:



```
Enter Burst Time and Priority

P[1]
Burst Time:6
Priority:3

P[2]
Burst Time:2
Priority:2

P[3]
Burst Time:14
Priority:1

P[4]
Burst Time:6
Priority:4

Process     Burst Time          Waiting Time    Turnaround Time
P[3]              14                  0               14
P[2]              2                   14              16
P[1]              6                   16              22
P[4]              6                   22              28

Average Waiting Time=13
Average Turnaround Time=20

Process returned 0 (0x0)   execution time : 39.613 s
Press any key to continue.
```

Discussion : In this lab we have implemented Priority Scheduling algorithm using C language. By solving this problem in future we can solve any problem of this algorithm.
